## WIZnet's Online Technical Support

If you have something to ask about WIZnet Products, Write down your question on Q&A Board in WIZnet website ([www.wiznet.co.kr](http://www.wiznet.co.kr)). WIZnet Engineer will give an answer as soon as possible.

The screenshot shows the WIZnet homepage with a central focus on the W5300 chip and module. The chip is labeled "W5300 P4FW0-162 0803". To the right, there's a "Wireless Module with Serial WIZ600Wi". Below the chip, there's a "RoHS Compliant" badge and a "Semiconductor Production Line Control System" news item from March 2008. On the left, there's a sidebar with links like "PRODUCTS", "TECHNOLOGY", "Q&A", "LIBRARY", "DISTRIBUTOR", "PARTNERSHIP", "BLOG", and "ABOUT US". The top navigation bar includes "HOME", "LOGIN", "JOIN", "CONTACT US", and language links for ENGLISH, CHINESE, JAPANESE, KOREAN, and "On-line Mall".

The screenshot shows the "Q&A" section of the website. It features a sidebar with "Q&A", "FAQ", and "E-FORUM" links. Below the sidebar is an "RSS Feed" button and a search bar with a "GO" button. The main area displays a list of posts with columns for "NO", "SUBJECT", "NAME", "DATE", and "HIT". The first post is titled "How to initialization TX\_WR Pointer" by "Andria Ginting" on 2008-05-19 with 30 hits. The last post is "recv size register does not return to .." by "WIZnet" on 2008-05-21 with 4 hits. The total number of posts is 2315 (1/116).

## 1 Introduction

Cross Compiler is used when user's development environment is different from the objective system. For example, when developing ARM-based embedded system, the user should write the source code at the PC, and compile the codes by using Cross Compiler. The compiled binary image operates not at the PC but at the ARM-based system.

### 1.1 Composition of Cross Compiler

There are several types of cross compiler - commercial compilers such as ADS/RVCT (provided by ARM) and GNU compiler. W5300E01-ARM provides GNU compiler. GNU compiler is composed of below

- *binutils*
  - Programming Tools for controlling various objective file format
- *gcc*
  - GNU Compiler
- *glibc*
  - Library used for cross compile

### 1.2 Before Starting

The arm-linux-gcc version of W5300E01-ARM is 3.4.3. So, for the cross compiling, 3.4.x version GCC is used. Please be sure to check version and install 3.4 version GCC.

From the next chapter, cross-compiling process is described step by step. As described in this manual, please install and make the compiler.

## 2 Source Code Download

- ① Compiler installation requires root authority for installation of system composing factors.

After logging in to root and create a directory as below.

- ***mkdir /cross\_tools***
- ***cd /cross\_tools***

```
WIZnet
kth321@huns-desktop:~$ su
Password:
root@huns-desktop:/home/kth321# mkdir /cross_tools
root@huns-desktop:/home/kth321# cd /cross_tools/
root@huns-desktop:/cross_tools# 
```

- ② Download 'binutils-2.15' source code.

➤ **wget <ftp://ftp.gnu.org/gnu/binutils/binutils-2.15.tar.bz2>**

```
WIZnet
root@huns-desktop:/cross_tools# wget ftp://ftp.gnu.org/gnu/binutils/binutils-2.15.tar.bz2
--17:25:34--  ftp://ftp.gnu.org/gnu/binutils/binutils-2.15.tar.bz2
              => `binutils-2.15.tar.bz2.1'
Resolving ftp.gnu.org... 140.186.70.20
Connecting to ftp.gnu.org|140.186.70.20|:21... connected.
Logging in as anonymous ... Logged in!

root@huns-desktop:/cross_tools# 
```

- ③ Download 'gcc-3.4.3' source code.

➤ **wget <ftp://ftp.gnu.org/gnu/gcc/gcc-3.4.3/gcc-3.4.3.tar.bz2>**

```
root@huns-desktop:/cross_tools# wget ftp://ftp.gnu.org/gnu/gcc/gcc-3.4.3/gcc-3.4.3.tar.bz2
--08:44:31--  ftp://ftp.gnu.org/gnu/gcc/gcc-3.4.3/gcc-3.4.3.tar.bz2
              => `gcc-3.4.3.tar.bz2.1'

root@huns-desktop:/cross_tools#
```

### 3 Linux Kernel Installation

The reason for installing Linux kernel source is to use the header file of the Linux kernel.

Before installing tool chain, install the Linux kernel codes provided by W5300E01-ARM, and create 'linux/version.h' file.

- ① Mount the CD in the package of W5300E01-ARM, and install the kernel source code for W5300E01-ARM. If CD-ROM is automatically mounted, the mount directory can be different according to release version.
  - ***mount /dev/cdrom /media/cdrom***
- ② Copy the kernel source into the '/usr/src' directory.
  - ***cp /media/cdrom/Software/LinuxKernel/linux-2.6.24.4-w5300e01.tar.gz /usr/src/***
- ③ Move to '/usr/src' directory, and extract the Linux kernel source file.
  - ***cd /usr/src***
  - ***tar zxvf linux-2.6.24.4-w5300e01.tar.gz***
  - ***cd linux-2.6.24.4-w5300e01***

```
root@huns-desktop:~# cp /media/cdrom/Software/LinuxKernel/linux-2.6.24.4-w5300e01.tar.gz /usr/src
root@huns-desktop:~# cd /usr/src
root@huns-desktop:/usr/src# tar zxvf linux-2.6.24.4-w5300e01.tar.gz
```

- ④ Create header file for compiler and symbolic link
  - ***make prepare***
- ⑤ In order to simplify the directory name, make the symbolic link.
  - ***cd ..***
  - ***ln -s linux-2.6.24.4-w5300e01 linux***

## 4 ‘binutils’ Installation

- ① Go to the working directory and extract the ‘binutils’ file.

```
➤ cd /cross_tools/  
➤ tar jxvf binutils-2.15.tar.bz2  
➤ cd binutils-2.15
```

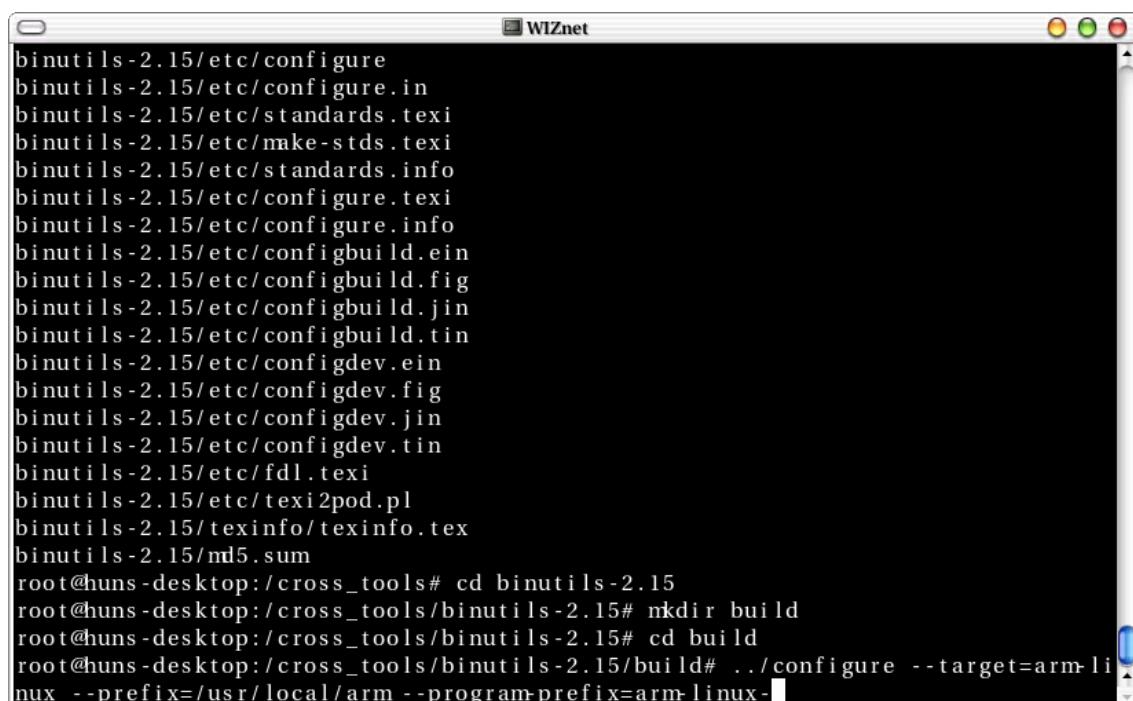

- ② Make the directory for ‘binutils’ compile.

```
➤ mkdir build  
➤ cd build
```

- ③ Configure the compiling environment.

In order to prevent overwriting the existing compiler, designate the installation directory as ‘/usr/local/arm’.

```
➤ ./configure --target=arm-linux --prefix=/usr/local/arm --program-prefix=arm-  
linux-
```

```
binutils-2.15/etc/configure  
binutils-2.15/etc/configure.in  
binutils-2.15/etc/standards.texi  
binutils-2.15/etc/make-stds.texi  
binutils-2.15/etc/standards.info  
binutils-2.15/etc/configure.texi  
binutils-2.15/etc/configure.info  
binutils-2.15/etc/configbuild.ein  
binutils-2.15/etc/configbuild.fig  
binutils-2.15/etc/configbuild.jin  
binutils-2.15/etc/configbuild.tin  
binutils-2.15/etc/configdev.ein  
binutils-2.15/etc/configdev.fig  
binutils-2.15/etc/configdev.jin  
binutils-2.15/etc/configdev.tin  
binutils-2.15/etc/fdl.texi  
binutils-2.15/etc/texi2pod.pl  
binutils-2.15/texinfo/texinfo.tex  
binutils-2.15/md5.sum  
root@huns-desktop:/cross_tools# cd binutils-2.15  
root@huns-desktop:/cross_tools/binutils-2.15# mkdir build  
root@huns-desktop:/cross_tools/binutils-2.15# cd build  
root@huns-desktop:/cross_tools/binutils-2.15/build# ./configure --target=arm-li  
nux --prefix=/usr/local/arm --program-prefix=arm-linux-■
```

- ④ Compile and install.

```
➤ make  
➤ make install
```

- ⑤ Export the directory to the PATH.

```
➤ export PATH=/usr/local/arm/bin:$PATH
```

## 5 ‘gcc’ Installation

Install the ‘gcc’ for compiling ‘glibc’ library and linux kernel. After installing ‘glibc’, the ‘gcc’ for developing Embedded software should be re-installed.

- ① Move to working directory, and extract ‘gcc’ compression.

```
➤ cd /cross_tools/  
➤ tar jxvf gcc-3.4.3.tar.bz2  
➤ cd gcc-3.4.3
```

- ② Modify ‘gcc/config/arm/t-linux’ file. (line 3)

➤ < Before >

```
TARGET_LIBGCC2_CFLAGS = -fomit-frame-pointer -fPIC
```

➤ < After >

```
TARGET_LIBGCC2_CFLAGS = -fomit-frame-pointer -fPIC -Dinhibit_libc  
-D__gthr_posix_h
```

- ③ Add some contents to ‘gcc/config/arm/t-linux’.

```
➤ echo "T_CFLAGS = -Dinhibit_libc -D__gthr_posix_h" >> gcc/config/arm/t-  
linux
```

- ④ Make the directory for ‘gcc’ compiling.

```
➤ mkdir build  
➤ cd build
```

- ⑤ Configure the environment for compile.

```
➤ ./configure --target=arm-linux --prefix=/usr/local/arm \  
--with-headers=/usr/src/linux/include --disable-shared --disable-threads \  
--enable-languages="c" -nfp --with-cpu=arm9tdmi --without-fp \  
--with-softfloat-support=internal
```

```
WIZnet

--disable-threads --enable-languages="c" --nfp --with-cpu=arm9tdmi --without-fp -
--with-softfloat-support=internal
```

⑥ Compile and install.

- ***make***
- ***make install***

⑦ Check the version.

- ***arm-linux-gcc -v***

```
WIZnet
root@huns-desktop:/cross_tools/gcc-3.4.3/build# export PATH=/usr/local/arm/bin:$PATH
root@huns-desktop:/cross_tools/gcc-3.4.3/build# arm-linux-gcc -v
Reading specs from /usr/local/arm/lib/gcc/arm-linux/3.4.3/specs
Configured with: ../configure --target=arm-linux --prefix=/usr/local/arm --with-

ages=c --nfp --with-cpu=arm9tdmi --without-fp --with-softfloat-support=internal
Thread model: single
gcc version 3.4.3
root@huns-desktop:/cross_tools/gcc-3.4.3/build#
```

## 6 ‘glibc’ Installation

- ① Move to working directory and extract ‘glibc’ compression.
  - `cd /cross_tools/`
  - `tar jxvf glibc-2.3.3.tar.bz2`
- ② Extract ‘linuxthreads’ compression at the ‘glibc’ directory.
  - `tar -C glibc-2.3.3 -jxvf glibc-linuxthreads-2.3.3.tar.bz2`
  - `cd glibc-2.3.3`
- ③ Modify ‘**Makeconfig**’ file. (line 514)
  - Before

```
gnulib := -lgcc -lgcc_eh
```
  - After

```
gnulib := -lgcc
```
- ④ Modify ‘**csu/Makefile**’ file.(line 107)
  - Before

```
CFLAGS-initfini.s = -g0 -fPIC -fno-inline-functions
```
  - After

```
CFLAGS-initfini.s = -O1 -g0 -fPIC -fno-inline-functions
```
- ⑤ Modify ‘**linuxthreads/Makefile**’ file.(line 104)
  - Before

```
CFLAGS-pt-initfini.s = -g0 -fPIC -fno-inline-functions
```
  - After

```
CFLAGS-pt-initfini.s = -O1 -g0 -fPIC -fno-inline-functions
```
- ⑥ Modify ‘**sysdeps/generic/framestate.c**’ file. (line 44)
  - Before

```
frame_state_for = fallback_frame_state_for;
```

➤ After

```
#ifndef __USING_SJLJ_EXCEPTIONS__
frame_state_for = fallback_frame_state_for;
#else
frame_state_for = abort;
#endif
```

- ⑦ Modify '**sysdeps/arm/machine-gmon.h**' file. (line 35 ~ 38)

➤ Before

```
static void mcount_internal (u_long frompc, u_long selfpc);

#define _MCOUNT_DECL(frompc, selfpc) \
static void mcount_internal (u_long frompc, u_long selfpc)
```

➤ After

```
#define _MCOUNT_DECL(frompc, selfpc) \
void mcount_internal (u_long frompc, u_long selfpc)
```

- ⑧ Modify '**sysdeps/unix/sysv/linux/arm/ioperm.c**' file. (line 98 ~ 104)

➤ Before

```
static int
init_iosys (void)
{
    char systype[256];
    int l, n;
    static int iobase_name[] = { CTL_BUS, BUS_ISA, BUS_ISA_PORT_BASE };
    static int ioshift_name[] = { CTL_BUS, BUS_ISA, BUS_ISA_PORT_SHIFT };
```

➤ After

```
#include <linux/version.h>
static int
init_iosys (void)
{
    char systype[256];
    int l, n;
#endif LINUX_VERSION_CODE < 132119
    static int iobase_name[] = { CTL_BUS, BUS_ISA, BUS_ISA_PORT_BASE };
    static int ioshift_name[] = { CTL_BUS, BUS_ISA, BUS_ISA_PORT_SHIFT };
#else
    static int iobase_name[] = { CTL_BUS, CTL_BUS_ISA, BUS_ISA_PORT_BASE };
    static int ioshift_name[] = { CTL_BUS, CTL_BUS_ISA, BUS_ISA_PORT_SHIFT };
#endif
```

- ⑨ Create a directory for 'glibc' compilie.

➤ ***mkdir build***  
 ➤ ***cd build***

- ⑩ Install compile environment.

➤ ***CC=arm-linux-gcc ./configure --host=arm-linux --build=i686-pc-linux-gnu \
--prefix=/usr/local/arm/arm-linux --with-headers=/usr/src/linux/include \
--enable-add-ons=linuxthreads --enable-shared***

- ⑪ Perform compile. If you get some error at the'***csu/version-info.h***' file during compiling, open & modify the file and re-compile it. (line 1~4)

➤ ***make***  
 ➤ Before

```
"Compiled on a Linux >>2.6.24-16-generic<< system on 2008-10-14
"
"Available extensions:
"
```

➤ After

```
"Compiled on a Linux >>2.6.24-16-generic<< system on 2008-10-14"
"Available extensions:"
```

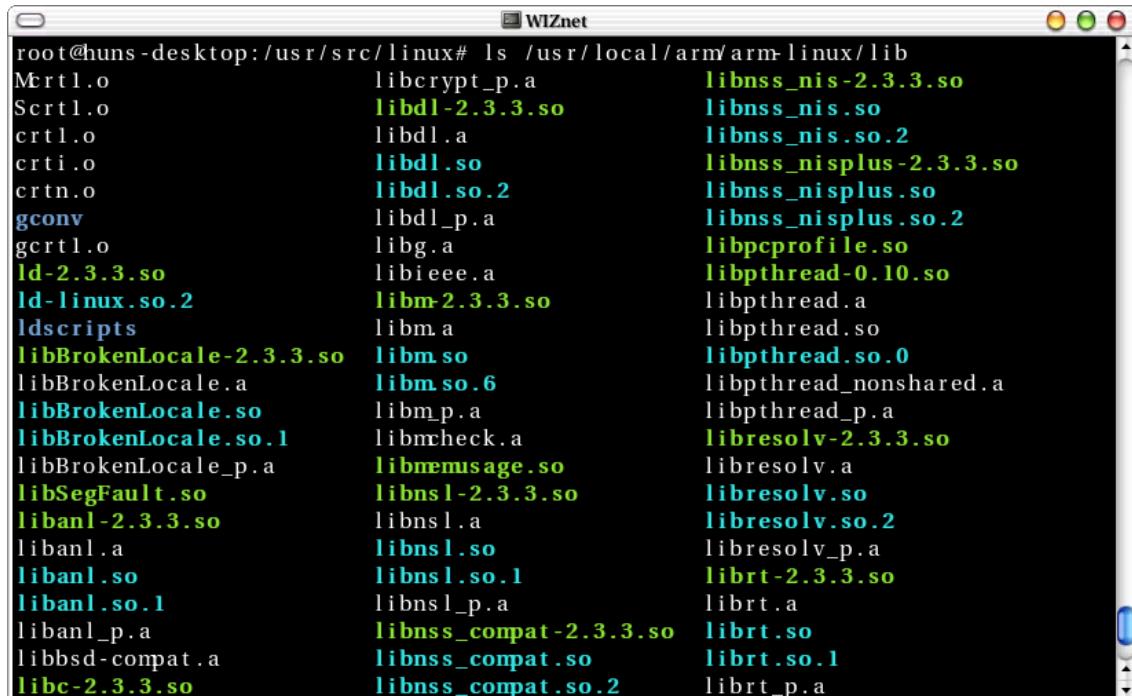

➤ ***make***

⑫ Install compiled ‘glibc’ library.

➤ ***make install***

⑬ Check installed ‘glibc’ library.

➤ ***ls /usr/local/arm/arm-linux/lib***

```
root@huns-desktop:/usr/src/linux# ls /usr/local/arm/arm-linux/lib
M crt1.o          libcrypt_p.a           libnss_nis-2.3.3.so

## 7 ‘gcc’ Re-Installation

Until now, we have prepared the development environment for cross compiling. If we re-install ‘gcc’, cross-compiler installation is completed.

- ① Delete the ‘gcc’ source code used before..

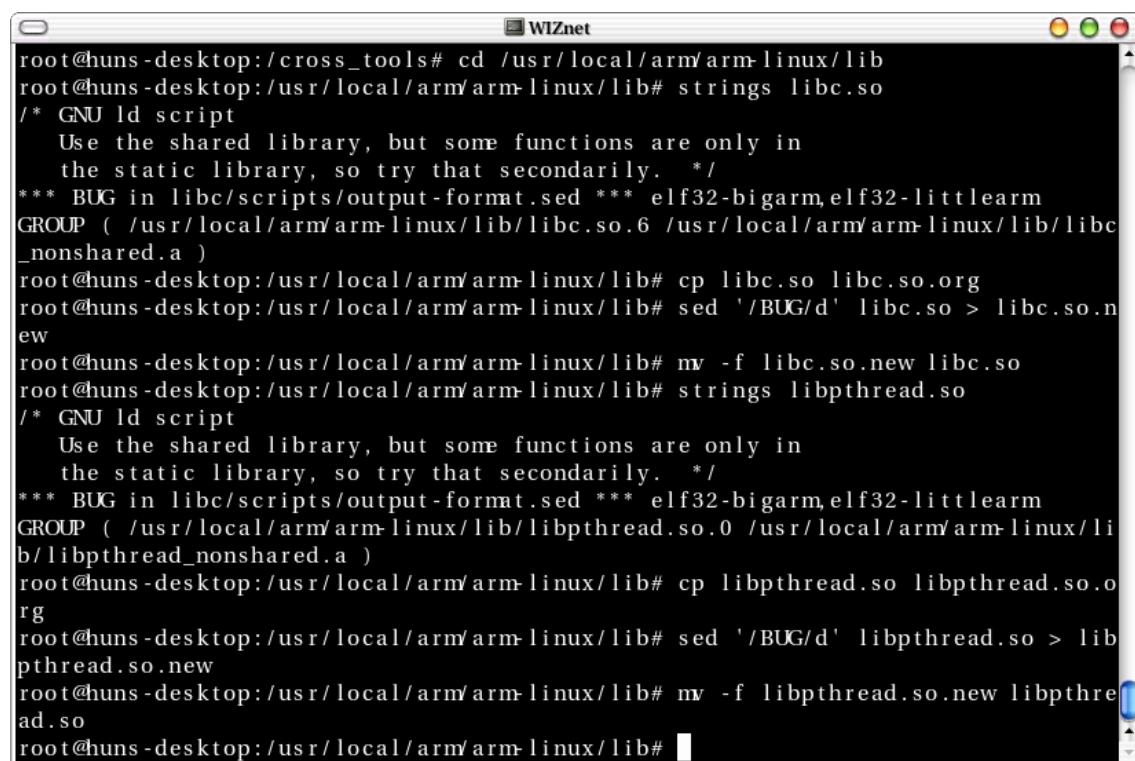

- ***cd /cross\_tools/***
- ***rm -rf gcc-3.4.3***

- ② Extract ‘gcc’ source code.

- ***tar jxvf gcc-3.4.3.tar.bz2***

- ③ Below modification should be done to prevent library dependency.

- ***cd /usr/local/arm/arm-linux/lib***
- ***strings libc.so***
- ***cp libc.so libc.so.org***
- ***sed '/BUG/d' libc.so > libc.so.new***
- ***mv -f libc.so.new libc.so***
- ***strings libpthread.so***
- ***cp libpthread.so libpthread.so.org***
- ***sed '/BUG/d' libpthread.so > libpthread.so.new***
- ***mv -f libpthread.so.new libpthread.so***

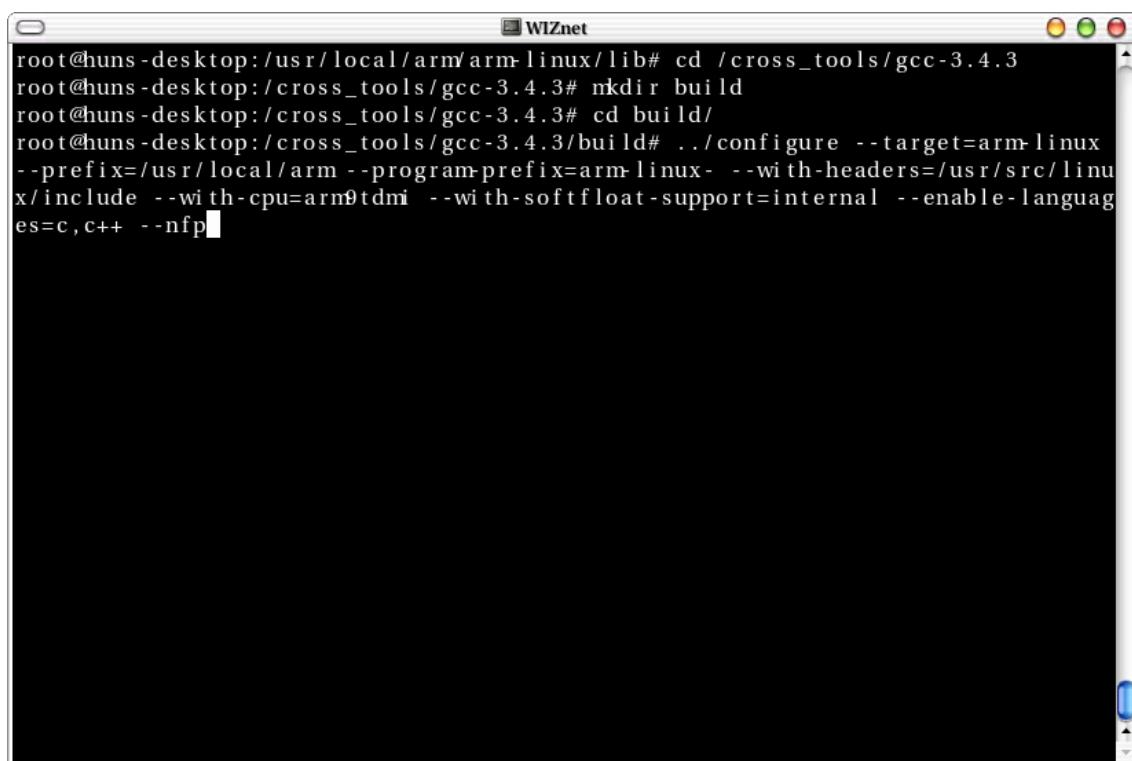

```

WIZnet
root@huns-desktop:/cross_tools# cd /usr/local/arm/arm-linux/lib
root@huns-desktop:/usr/local/arm/arm-linux/lib# strings libc.so
/* GNU ld script
   Use the shared library, but some functions are only in

```

- ④ Create a directory for 'gcc' compiling.
  - **cd /cross\_tools/gcc-3.4.3**
  - **mkdir build**
  - **cd build**
- ⑤ Configure compile environment.
  - **../configure --target=arm-linux --prefix=/usr/local/arm --program-prefix=arm-linux- \**
  - with-headers=/usr/src/linux/include --with-cpu=arm9tdmi \**
  - with-softfloat-support=internal --enable-languages=c,c++ --nfp**

A terminal window titled "WIZnet" showing the execution of commands to configure and build the ARM cross compiler. The commands entered are:

```
root@huns-desktop:/usr/local/arm/arm-linux/lib# cd /cross_tools/gcc-3.4.3
root@huns-desktop:/cross_tools/gcc-3.4.3# mkdir build
root@huns-desktop:/cross_tools/gcc-3.4.3# cd build/
root@huns-desktop:/cross_tools/gcc-3.4.3/build# ../configure --target=arm-linux
--prefix=/usr/local/arm --program-prefix=arm-linux- --with-headers=/usr/src/linux/include
--with-cpu=arm9tdmi --with-softfloat-support=internal --enable-languages=c,c++ --nfp
```

- ⑥ Compile and install
  - **make**
  - **make install**

## 8 Test

- ① For the testing, we will make example program 'Hello WIZnet'.

➤ Write '/cross\_tools/hello.c'

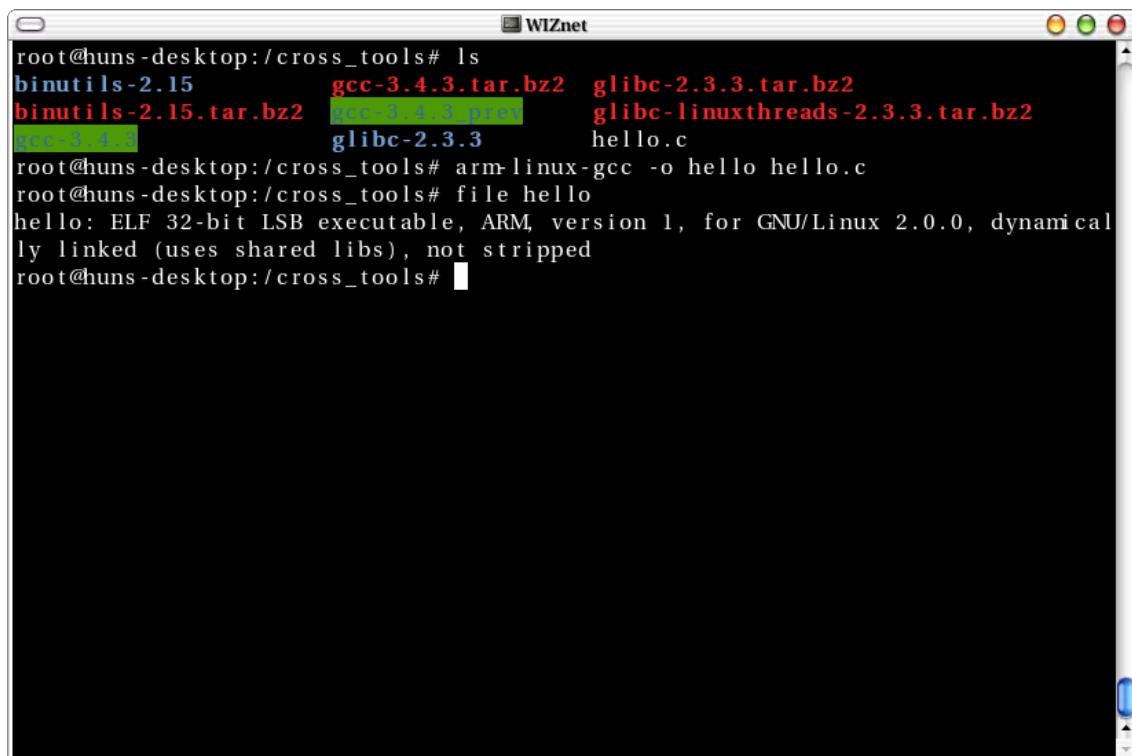

```
#include <stdio.h>

Int main(void)
{
    printf("Hello WIZnet\n");
    return 0;
}
```

- ② With newly created cross-compiler, compile 'hello.c' source code.

➤ **arm-linux-gcc -o hello hello.c**

➤ **file hello**

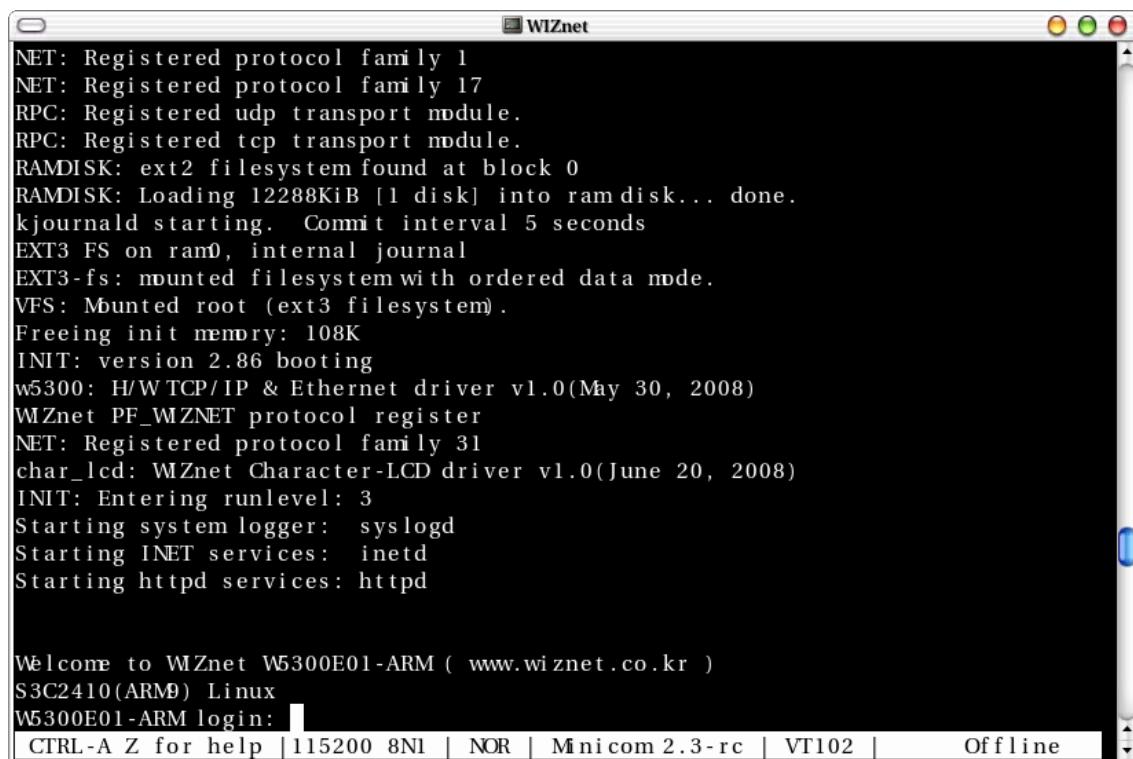

The terminal window shows the following command-line session:

```
root@huns-desktop:/cross_tools# ls
binutils-2.15      gcc-3.4.3.tar.bz2  glibc-2.3.3.tar.bz2
binutils-2.15.tar.bz2  gcc-3.4.3_prev  glibc-linuxthreads-2.3.3.tar.bz2
gcc-3.4.3          glibc-2.3.3        hello.c
root@huns-desktop:/cross_tools# arm-linux-gcc -o hello hello.c
root@huns-desktop:/cross_tools# file hello
hello: ELF 32-bit LSB executable, ARM, version 1, for GNU/Linux 2.0.0, dynamically linked (uses shared libs), not stripped
root@huns-desktop:/cross_tools#
```

- ③ After connecting 'W5300E01-ARM' board and PC, execute 'minicom'. After executing 'minicom', supply the power to the board. For the detailed information about 'minicom' configuration, refer to 'W5300E01-ARM User Manual', chapter '4.1.2 Booting Check at the Linux'.

➤ **minicom**

```

- ④ If booting is completed, log in to ‘root’ and transmit the ‘hello’ program to serial. W5300
- root
  - ‘Ctrl’ + ‘a’,‘s’
  - Select ‘Zmodem’
  - Move to ‘/cross\_tools’
  - Select ‘hello’ file by using space key.
  - Transmit the file from PC to ‘W5300E01-ARM’ by pressing enter key
