1 Document information

1.1 Revision history

Version	Date	Description of change
V1.0.0	2022-12-01	Initial Release
V1.0.1	2022-12-02	Fix Section 4. Prepare your Device Add Wi-Fi configuration contents in Section 5. Build SDK and Run Samples

2 Introduction

This document describes how to connect **WizFi360-EVB-Pico** running **Windows 10** with Azure IoT SDK. This multi-step process includes:

- Configuring Azure IoT Hub
- Registering your IoT device
- Provisioning your devices on Device Provisioning service
- Build and deploy Azure IoT SDK on device

3 Prerequisites

3.1 Prepare your development environment

3.1.1 Tools installation

Windows 10 was used during preparation of this guide document. Linux and MacOS user should use compatible software, hardware-wise there is no difference. Please refer to the guide in *section 3.1.3* to find instructions for installing toolchain on Linux and MacOS.

1) Install the Toolchain

To build you will need to install extra tools below.

- [ARM GCC compiler](#)
- [CMake](#)
- [Build Tools for Visual Studio](#)
- [Python 3.9](#)
- [Git](#)
- [Visual Studio Code](#)

Download the executable installer for each of these from the links above, and then carefully follow the instructions in the following sections to install all six packages on to your Windows computer.

① Install ARM GCC compiler

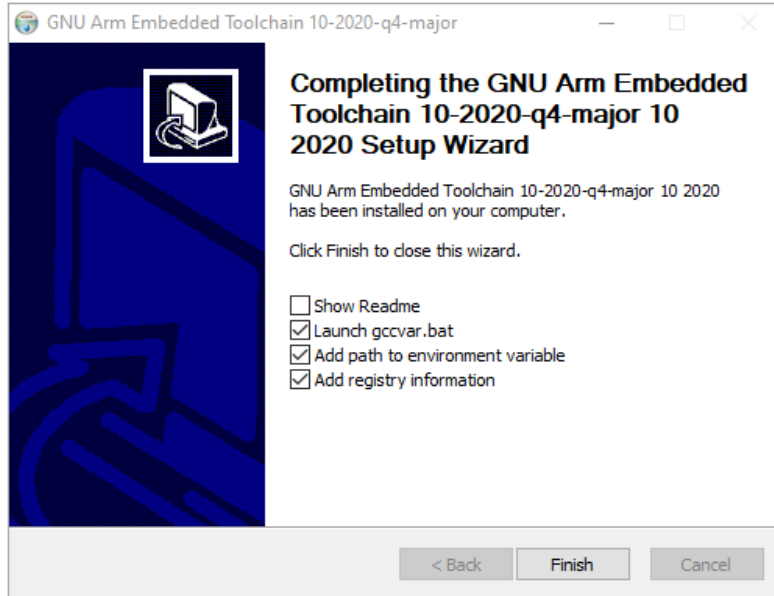

Figure 1. Install ARM GCC compiler

During installation you should check the box to register the path to the ARM compiler as an environment variable in the Windows shell when prompted to do so.

② Install CMake

Figure 2. Install CMake

During the installation add CMake to the system **PATH** for all users when prompted by the installer.

③ Install Build Tools for Visual Studio

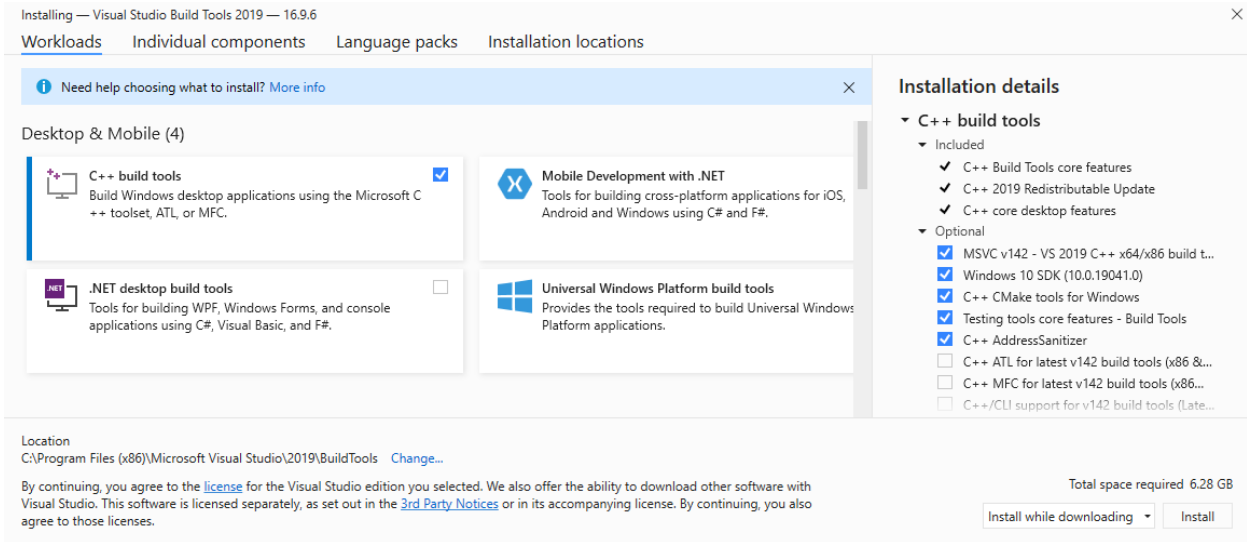

Figure 3. Install Build Tools for Visual Studio

When prompted by the Build Tools for Visual Studio installer you need to install the C++ build tools only.

④ Install Python 3.9

During the installation, ensure that it's installed 'for all users' and add Python 3.9 to the system **PATH** when prompted by the installer. You should additionally disable the **MAX_PATH** length limit when prompted at the end of the Python installation.

Figure 4. Install Python

⑤ Install Git

When installing Git you should ensure that you change the default editor away from vim.

Figure 5. Install Git

⑥ Install Visual Studio Code

During the installation add Visual Studio Code to the system **PATH**.

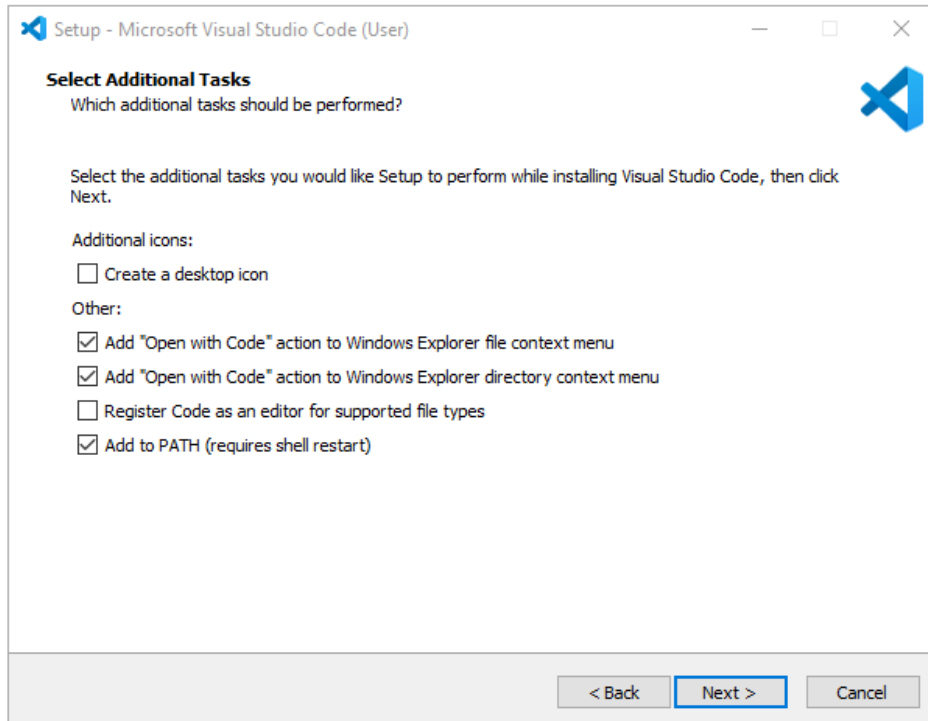

Figure 6. Install Visual Studio Code

2) Clone the **Raspberry Pi Pico SDK** and WIZnet's **Azure IoT SDK example** using below commands

- Raspberry Pi Pico SDK : <https://github.com/raspberrypi/pico-sdk>
- Azure IoT SDK example : <https://github.com/Wiznet/WizFi360-EVB-Pico-AZURE-C>

```
// create a project directory
D:\>mkdir RP2040
D:\>cd RP2040

// get the SDK
D:\RP2040> git clone -b master https://github.com/raspberrypi/pico-sdk.git
D:\RP2040> cd pico-sdk
D:\RP2040\pico-sdk> git submodule update --init

// get the example
D:\RP2040\pico-sdk> cd ..
D:\RP2040> git clone -b main https://github.com/Wiznet/WizFi360-EVB-Pico-AZURE-C.git
D:\RP2040> cd WizFi360-EVB-Pico-AZURE-C
```

```
D:\RP2040\WizFi360-EVB-Pico-AZURE-C> git submodule update --init
```

```
C:\Windows\System32\cmd.exe

```

Figure 7. Get the SDK and example

3) Setup Visual Studio Code

- ① Open a new Visual Studio 2019 Developer Command Prompt
- ② Run the below command to open Visual Studio Code

```
D:> code -n
```

- ③ Opening Visual Studio Code from Developer Command Prompt
- ④ Open Extensions

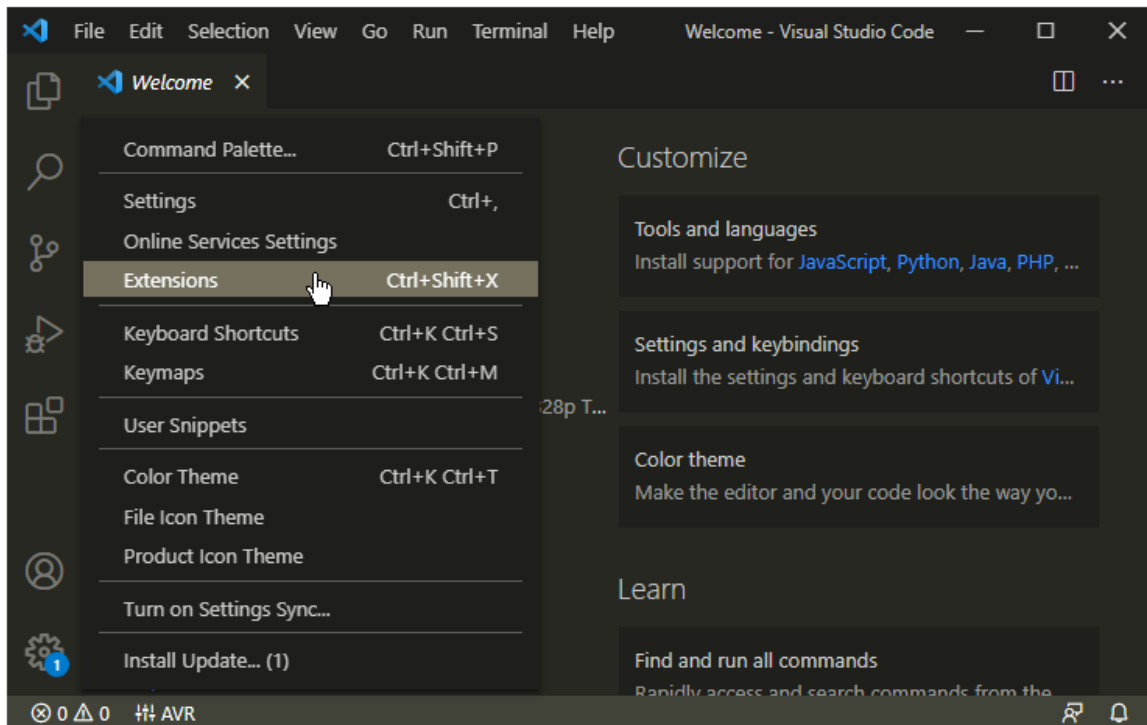

Figure 8. Install Extensions in Visual Studio Code

- ⑤ Install some tools
 - CMake Tools
 - C/C++
- ⑥ Open CMake Tools Extension Settings
- ⑦ Scroll down and setup some items
 - Add Cmake: Configure Environment Item as **PICO_SDK_PATH**
 - Add Cmake: Configure Environment Value as **D:\RP2040\pico-sdk**
 - Add Cmake: Generator as **NMake Makefiles**

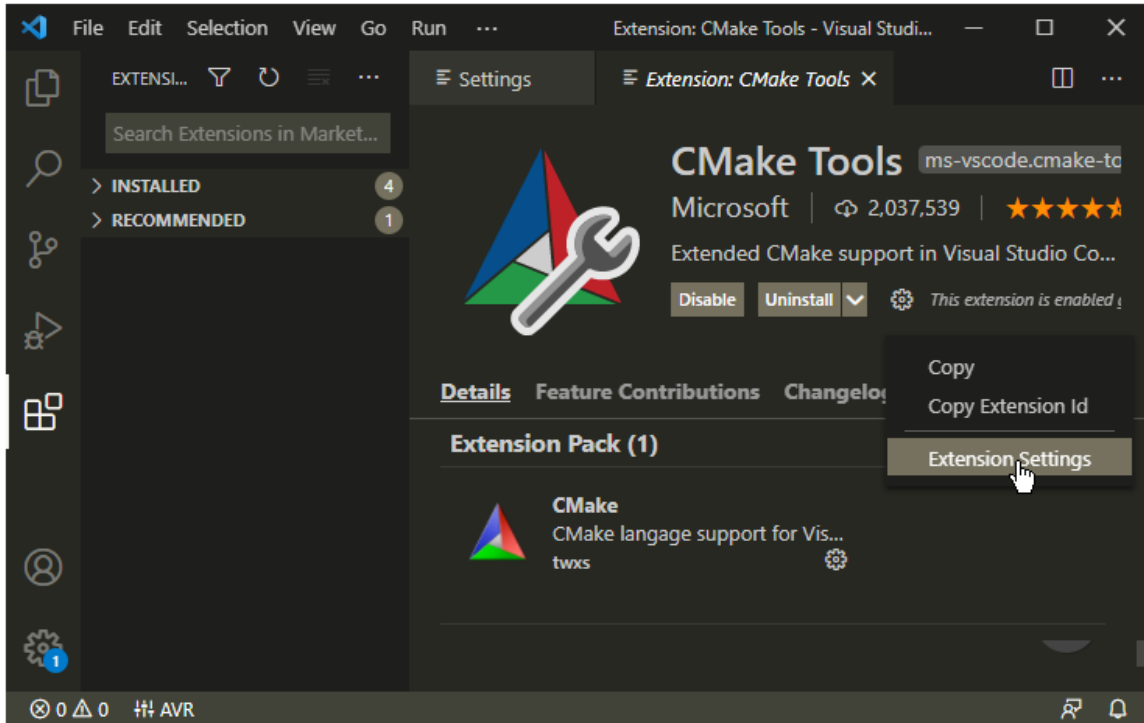

Figure 9. CMake Tools Extension Settings in Visual Studio Code

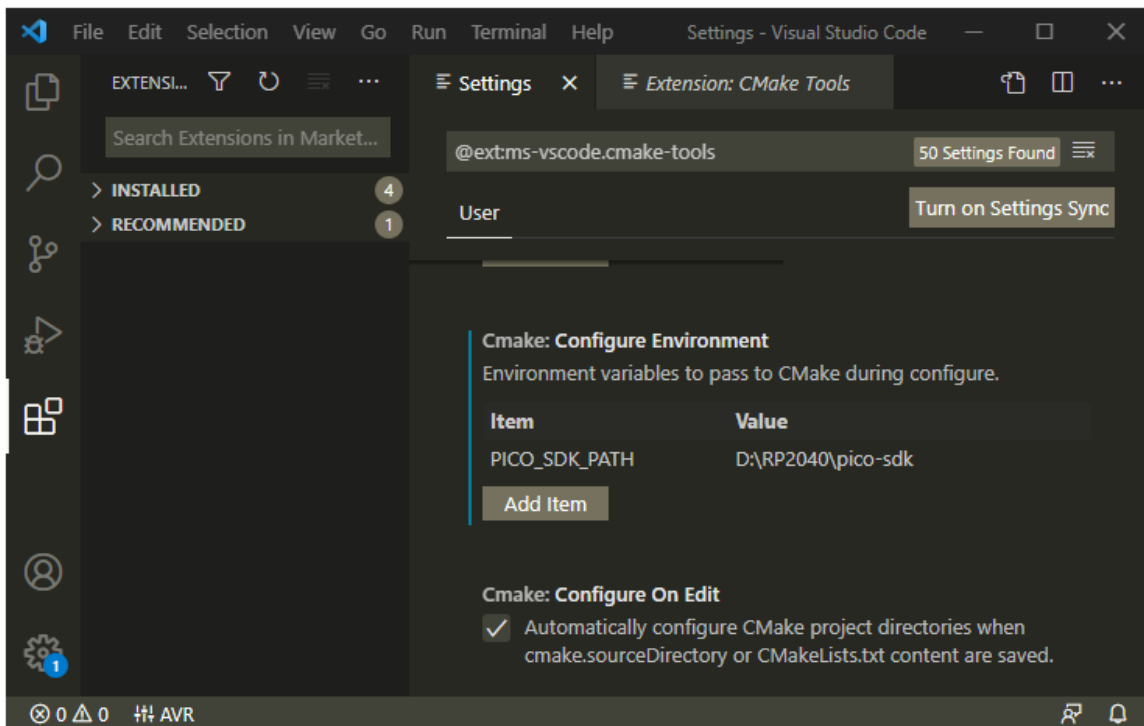

Figure 10. Add CMake Configure Environment path

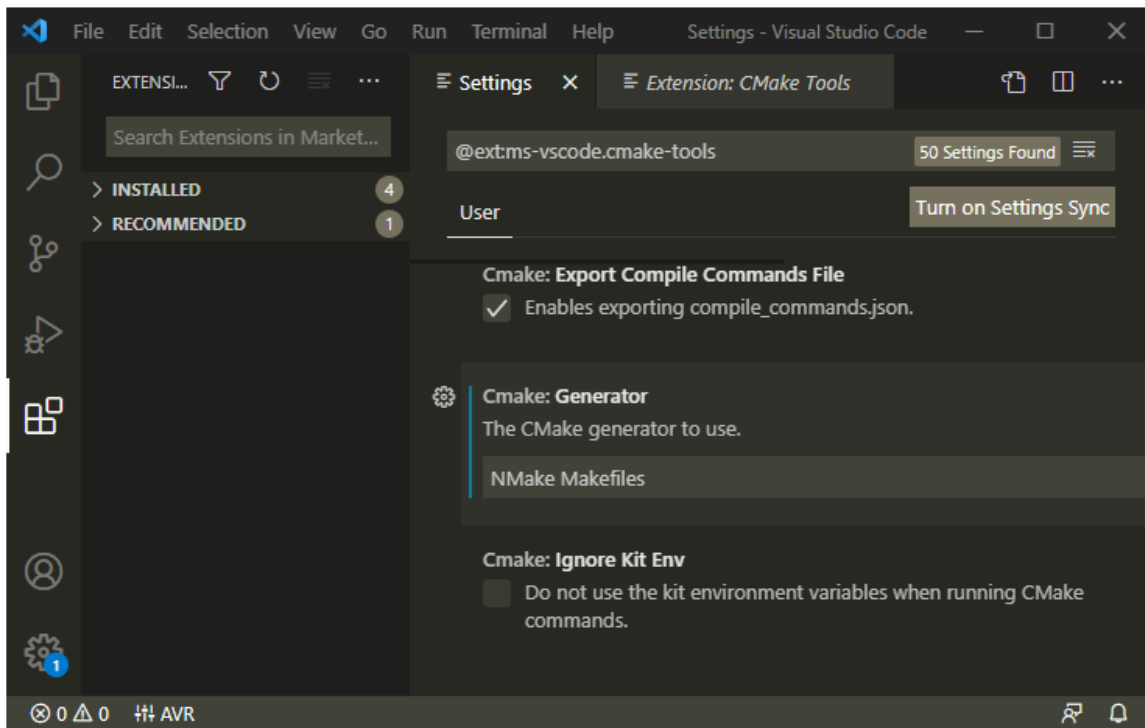

Figure 11. Add CMake Generator name

- ⑧ Add folder WizFi360-EVB-Pico-AZURE-C to Visual Studio Code
- ⑨ Visual Studio Code will scan for kits
- ⑩ Select 'Yes' when asked: Would you like to configure project WizFi360-EVB-Pico-AZURE-C?
- ⑪ Select 'Yes' if you like to configure the project upon opening
- ⑫ Click CMake in the bottom bar to select the kit WizFi360-EVB-Pico-AZURE-C
- ⑬ Select Debug / Release based on your preference
- ⑭ Visual Studio Code will save all file and configure the project
- ⑮ Click on Build to build all examples, if no error Build will finish with exit code 0

3.1.2 Other software required to develop and debug applications for the device

Serial terminal program is required for operation check and debugging.

- [Tera Term](#)

You may use your preferred serial terminal program.

3.1.3 Additional software references

Refer to the '**9.2. Building on MS Windows**' section of '**Getting started with Raspberry Pi Pico**' guide document below to setup the development environment.

- [Getting started with Raspberry Pi Pico](#)

3.2 Setup your IoT Hub

Refer to the '**Create an IoT hub**' section of '**Quickstart: Set up the IoT Hub Device Provisioning Service with the Azure portal**' guide below to setup the IoT Hub.

- [Quickstart: Set up the IoT Hub Device Provisioning Service with the Azure portal](#)

3.3 Provision your device over DPS

Refer to the '**Create a new IoT Hub Device Provisioning Service**' section of '**Quickstart: Set up the IoT Hub Device Provisioning Service with the Azure portal**' guide below to setup the DPS.

- [Quickstart: Set up the IoT Hub Device Provisioning Service with the Azure portal](#)

After completing the DPS settings according to the guide document above, some additional settings are required.

1) Generate the certificate in X.509 format required when provisioning the device

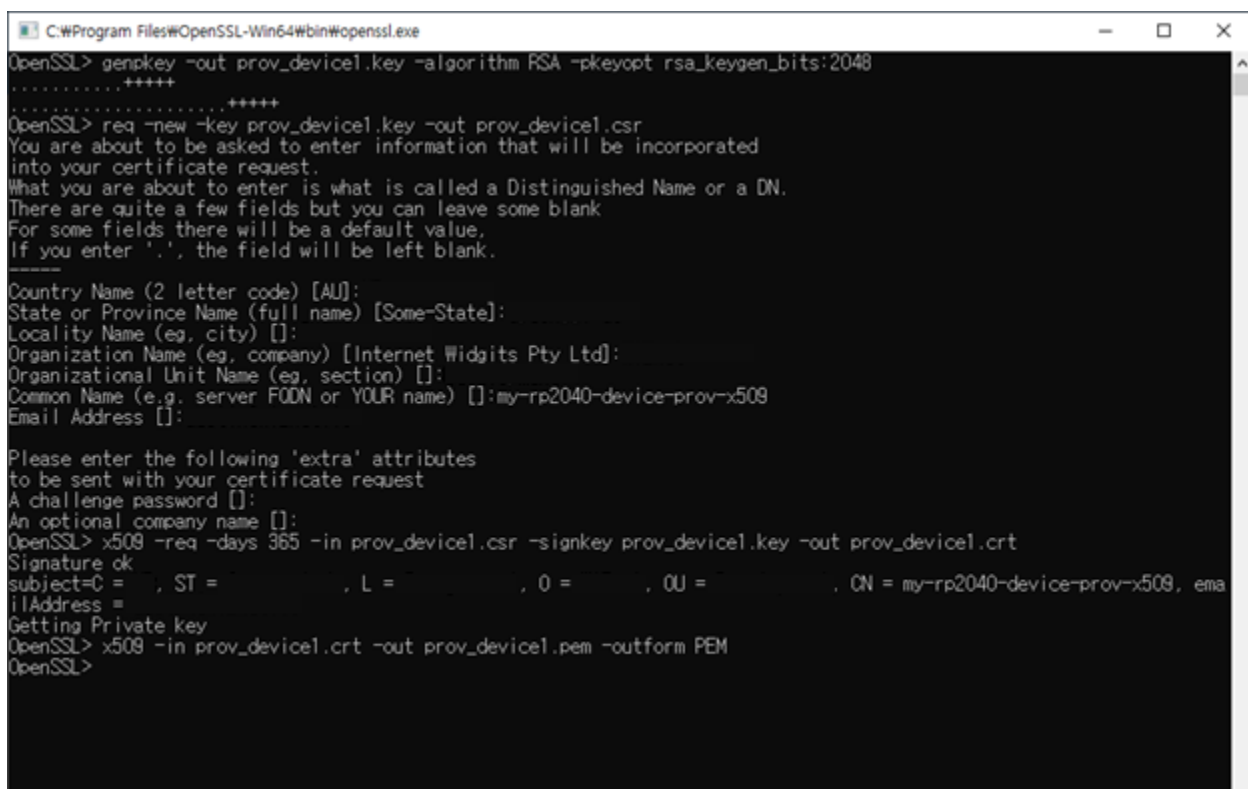

Generate the certificate in X.509 format that is required when provisioning the device using OpenSSL.

For the OpenSSL commands to generate the certificate in X.509 format, refer to the following.

```
/* Generate the certificate */  
OpenSSL> genpkey -out [key name].key -algorithm RSA -pkeyopt  
rsa_keygen_bits:2048  
OpenSSL> req -new -key [key name].key -out [csr name].csr
```

```
OpenSSL> x509 -req -days 365 -in [csr name].csr -signkey [key name].key -
out [crt name].crt
OpenSSL> x509 -in [crt name].crt -out [pem name].pem -outform PEM

// e.g.
OpenSSL> genpkey -out prov_device1.key -algorithm RSA -pkeyopt
rsa_keygen_bits:2048
OpenSSL> req -new -key prov_device1.key -out prov_device1.csr
OpenSSL> x509 -req -days 365 -in prov_device1.csr -signkey prov_device1.key
-out prov_device1.crt
OpenSSL> x509 -in prov_device1.crt -out prov_device1.pem -outform PEM
```

```
C:\Program Files\OpenSSL-Win64\bin\openssl.exe
OpenSSL> genpkey -out prov_device1.key -algorithm RSA -pkeyopt rsa_keygen_bits:2048
.....+++++
.....+++++
OpenSSL> req -new -key prov_device1.key -out prov_device1.csr
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value,
If you enter '.', the field will be left blank.
-----

4 Prepare your Device

4.1 Connect with 5 pin micro USB cable.

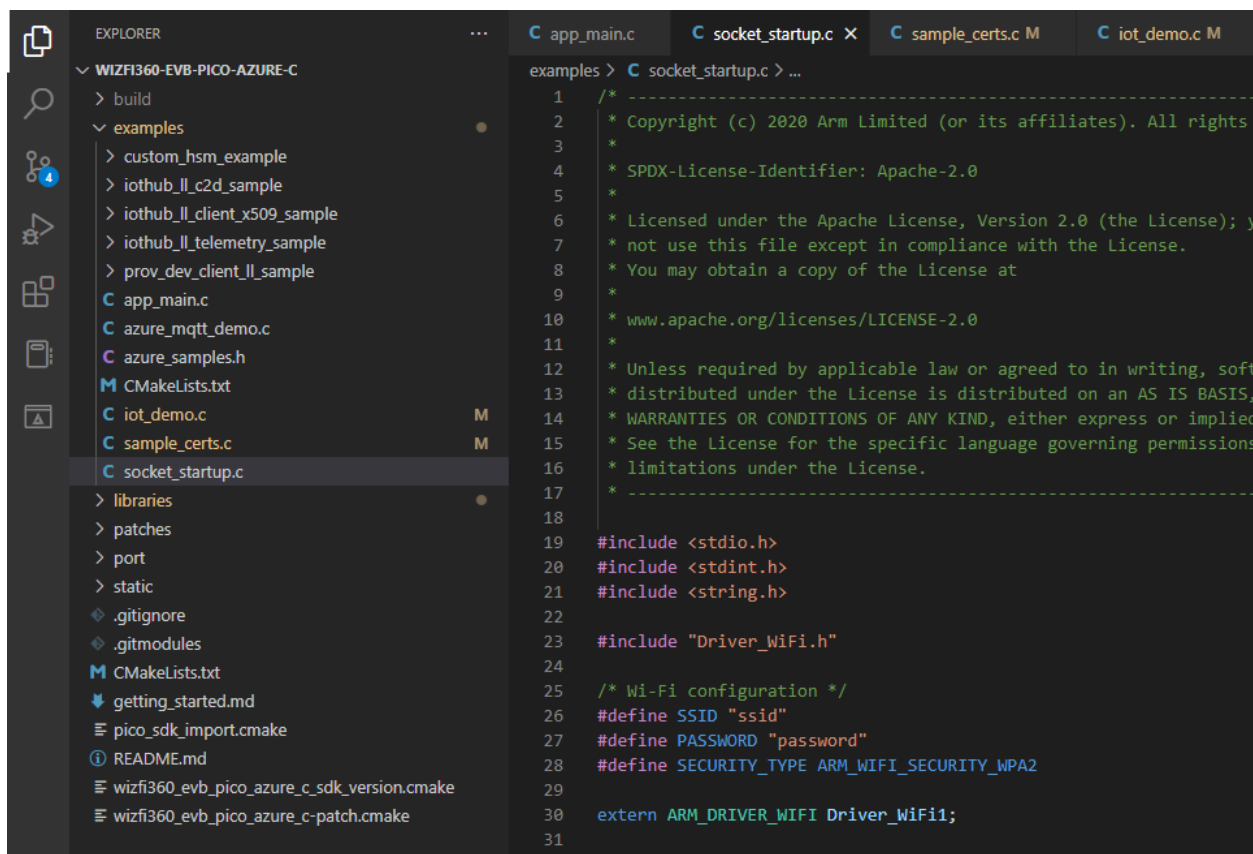

Connect device to desktop or laptop using 5 pin micro USB cable.

5 Build SDK and Run Samples

5.1 Setup Wi-Fi configuration

Setup Wi-Fi configuration in 'socket_startup.c' in the 'WizFi360-EVB-Pico-AZURE-C\examples\' directory.

```
/* Wi-Fi configuration */
#define SSID "ssid"
#define PASSWORD "password"
#define SECURITY_TYPE ARM_WIFI_SECURITY_WPA2
```

```
examples > C socket_startup.c > ...

28 #define SECURITY_TYPE ARM_WIFI_SECURITY_WPA2
29
30 extern ARM_DRIVER_WIFI Driver_WiFi1;
31
```

Figure 16. Setup Wi-Fi configuration

5.2 Select sample application

Since you need to use the **prov_dev_client_ll_sample** sample application, uncomment the following in 'iot_demo.c' in the 'WizFi360-EVB-Pico-AZURE-C\examples\' directory to configure the sample application.

```
/**
```

```

* -----
* Macros
* -----
*/
// The application you wish to use should be uncommented
//
// #define APP_TELEMETRY
// #define APP_C2D
// #define APP_CLI_X509
#define APP_PROV_X509

```

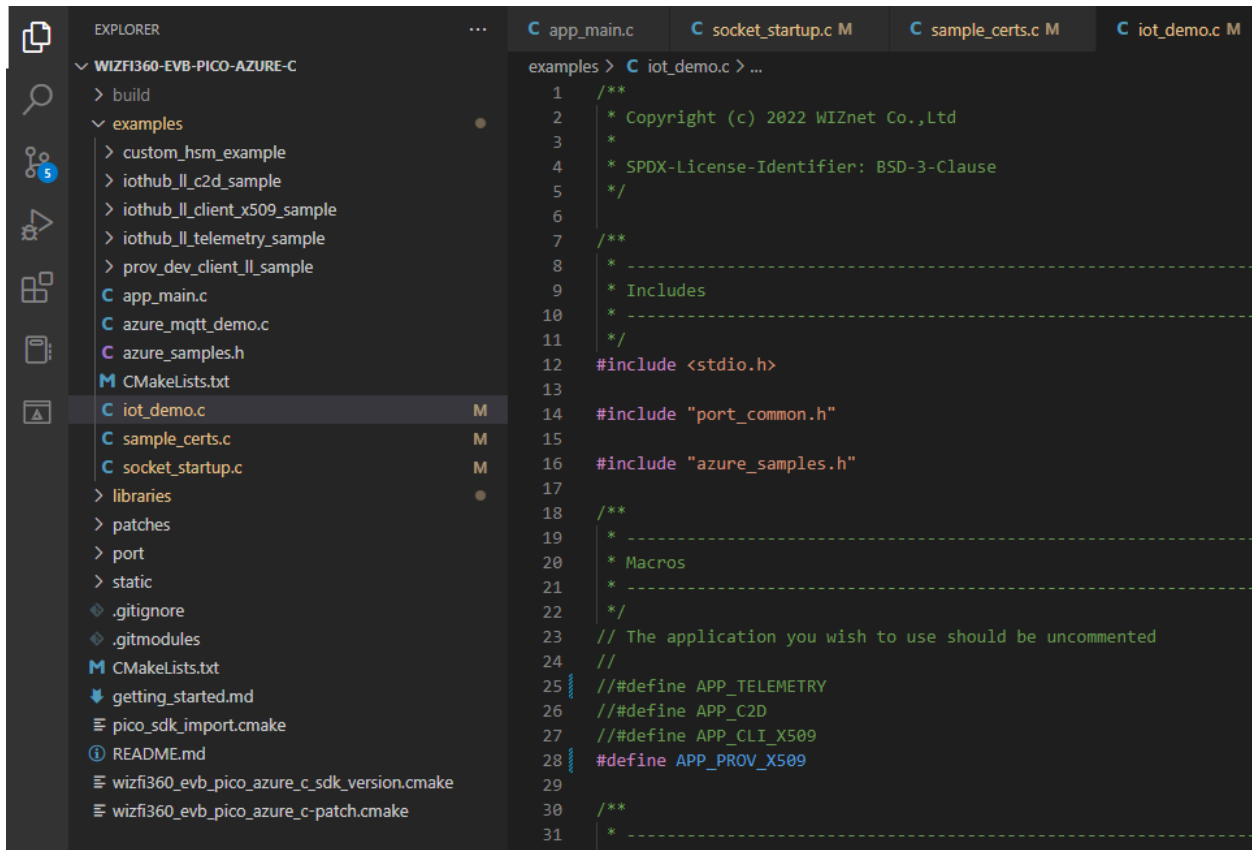

Figure 17. Setup sample application

5.3 Enter certificate and DPS related information

For provisioning the device to the IoT Hub through DPS and connecting to IoT Hub, enter **ID scope**, **common name**, and **certificate in X.509 format** generated and registered in *section 3.3*.

The ID scope can be checked in the Device Provisioning Service set in the Azure Portal.

Figure 18. ID scope

The common name is one of the information entered when generating the certificate in X.509 format in OpenSSL.

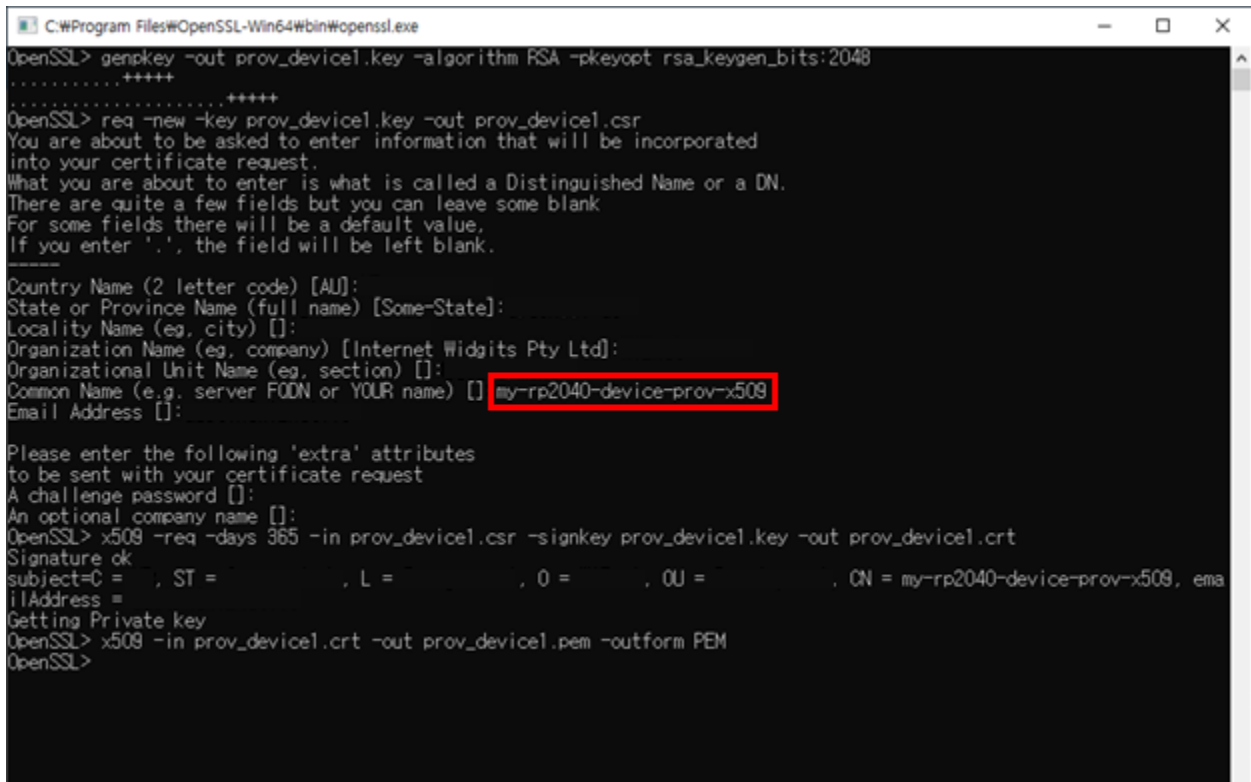

Figure 19. Common Name

Setup the above information in 'sample_certs.c' in the 'WizFi360-EVB-Pico-AZURE-C\examples\' directory.

```

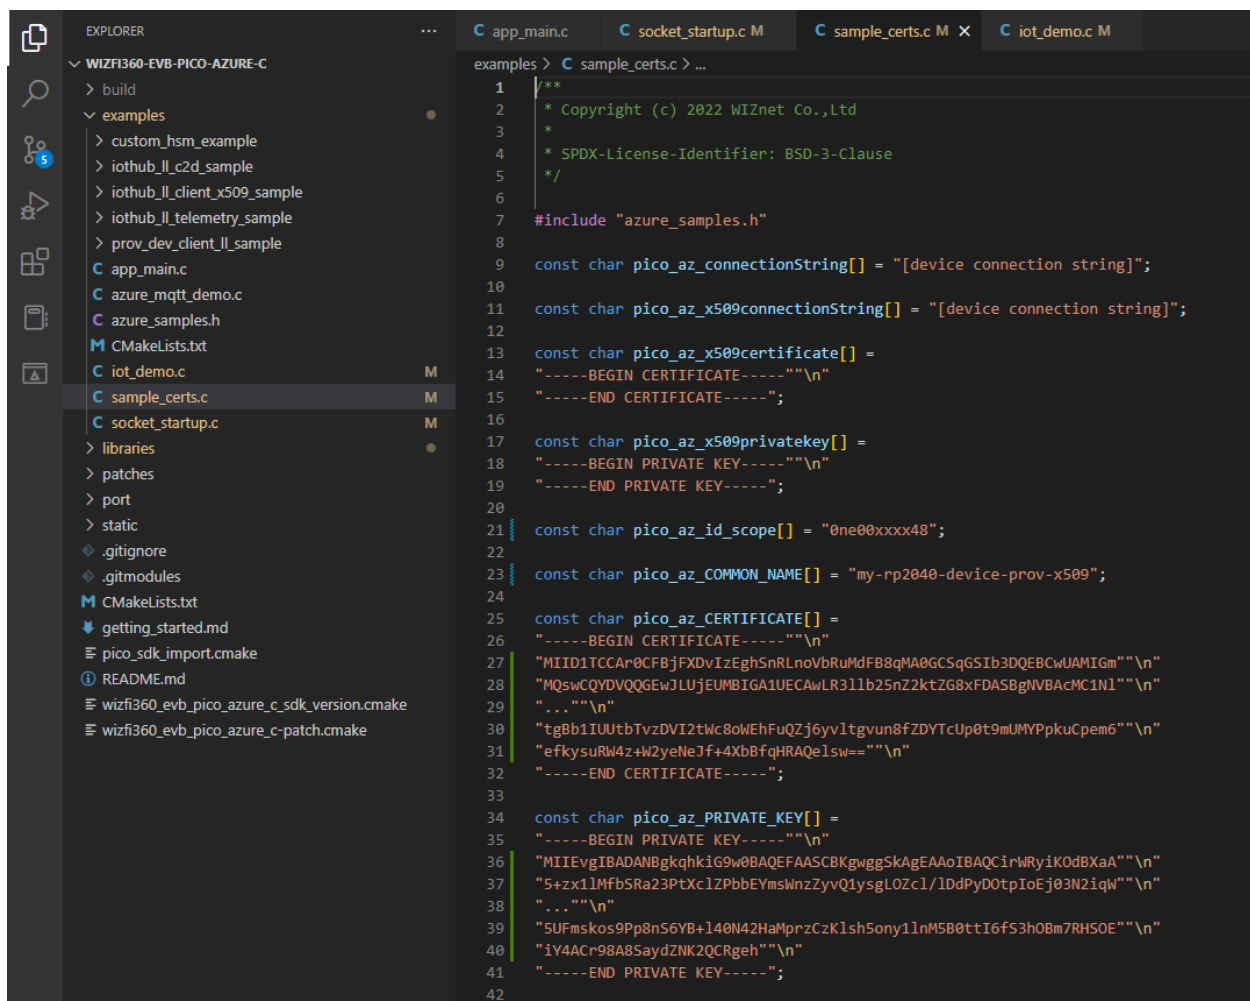

const char pico_az_id_scope[] = "[ID Scope]";

const char pico_az_COMMON_NAME[] = "[custom-hsm-device]";

const char pico_az_CERTIFICATE[] =
"-----BEGIN CERTIFICATE-----""\n"
"-----END CERTIFICATE-----";

const char pico_az_PRIVATE_KEY[] =
"-----BEGIN PRIVATE KEY-----""\n"
"-----END PRIVATE KEY-----";

```

The screenshot shows the Visual Studio Code interface with the Explorer view on the left and the Code view on the right. The Explorer view shows a project structure for 'WIZFI360-EVB-PICO-AZURE-C' with folders like 'build', 'examples', and 'libraries'. The 'examples' folder is expanded, showing files like 'custom_hsm_example', 'iothub_ll_c2d_sample', 'iothub_ll_client_x509_sample', 'iothub_ll_telemetry_sample', 'prov_dev_client_ll_sample', 'app_main.c', 'azure_mqtt_demo.c', 'azure_samples.h', 'CMakeLists.txt', 'iot_demo.c', 'sample_certs.c', and 'socket_startup.c'. The 'sample_certs.c' file is selected and its content is displayed in the Code view. The code in 'sample_certs.c' includes a copyright notice for WIZnet Co., Ltd. and defines several constants for Azure IoT Hub certificates and keys, including 'pico_az_connectionString', 'pico_az_x509connectionString', 'pico_az_x509certificate', 'pico_az_x509privatekey', 'pico_az_id_scope', 'pico_az_COMMON_NAME', 'pico_az_CERTIFICATE', and 'pico_az_PRIVATE_KEY'.

Figure 20. Setup 'sample_certs.c'

5.4 Build example

1) After completing the Azure IoT SDK example configuration, click 'build' in the status bar at the bottom of Visual Studio Code or press the 'F7' button on the keyboard to build.

2) When the build is completed, '**azure_mqtt_demo.uf2**' is generated in the '**WizFi360-EVB-Pico-AZURE-C\build\examples**' directory.

5.5 Upload firmware

1) While pressing the **BOOTSEL** button of the device power on the board, the USB mass storage '**RPI-RP2**' is automatically mounted.

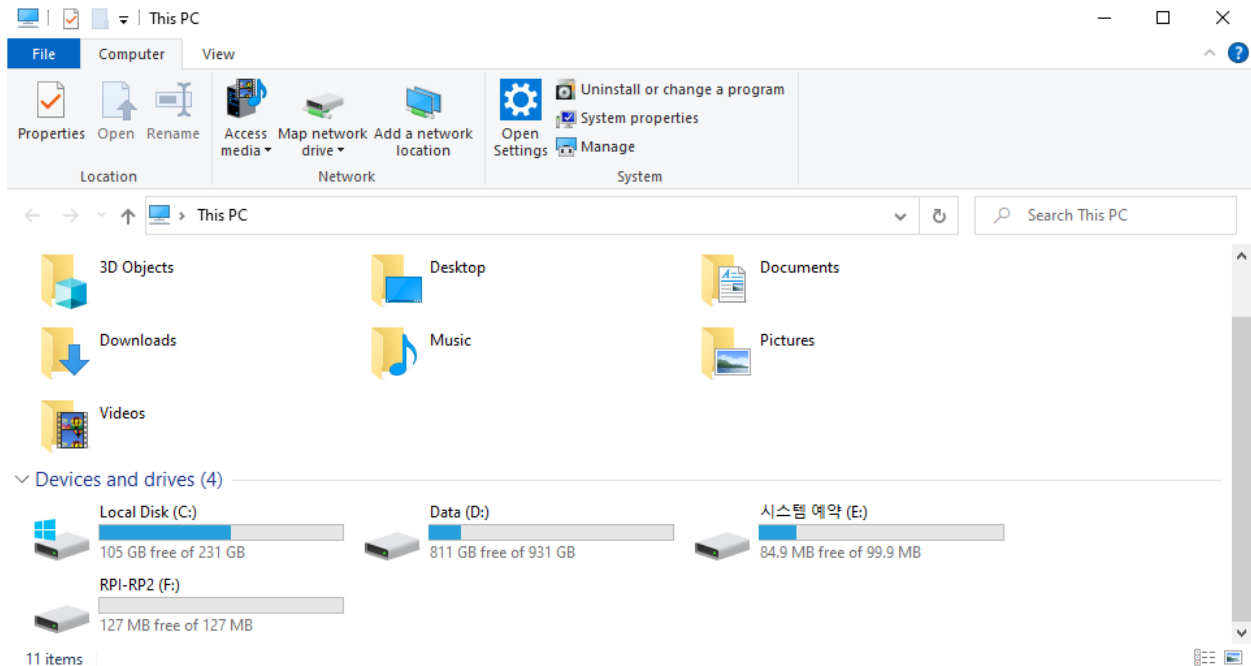

Figure 21. Automatically mounted USB mass storage 'RPI-RP2'

2) Drag and drop '**azure_mqtt_demo.uf2**' onto the USB mass storage device '**RPI-RP2**'.

5.6 Run sample application

First, connect to the serial COM port of the device with terminal program.

When connecting to the serial COM port of the device, use following settings to setup the serial port.

- Baud rate : 115,200
- Data bit : 8
- Parity bit : none

- Stop bit : 1
- Flow control : none

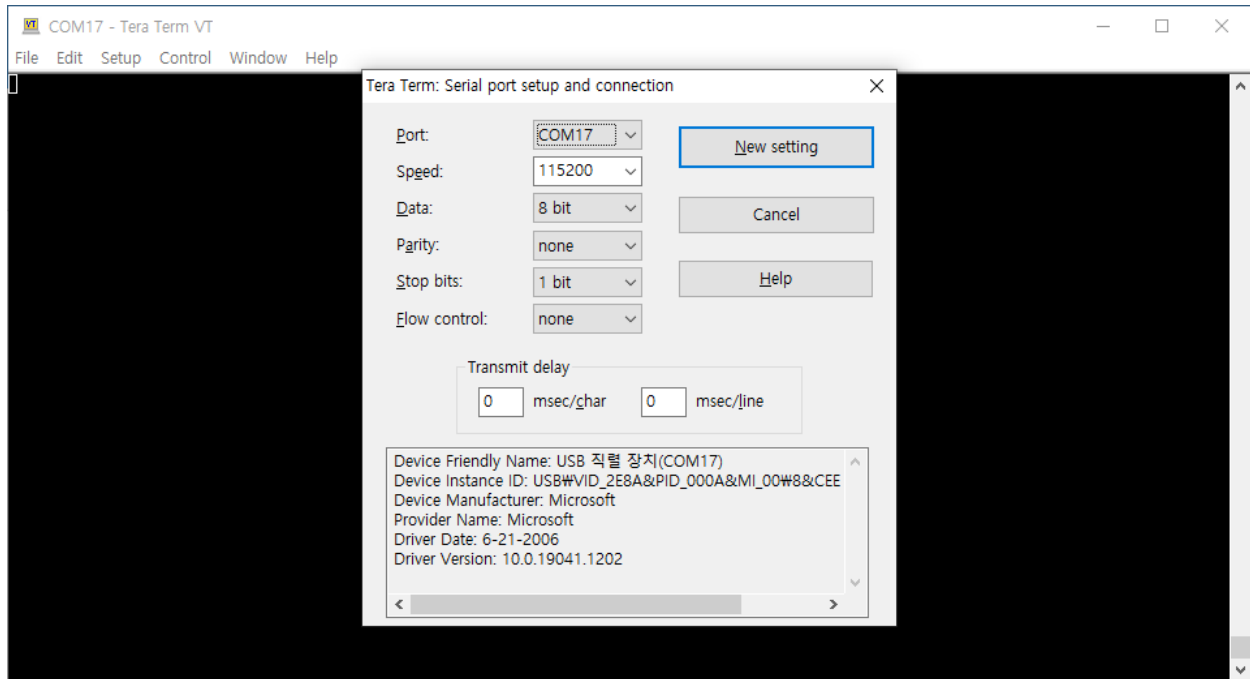

Figure 22. Setup serial port

If sample application is running normally, in terminal you should be able to see registering to the IoT Hub through DPS, and sending data from the device to the IoT Hub.

Figure 24. Sending data from device to IoT Hub

6 Integration with Azure IoT Explorer

6.1 Run Azure IoT explorer

Run Azure IoT explorer.

Figure 25. Run Azure IoT explorer

If Azure IoT explorer is not installed, download the latest version Azure IoT explorer from the link below and install it.

- [Azure IoT explorer](#)

6.2 Enter IoT Hub connection string and connect to Azure IoT explorer

Enter the connection string of the IoT Hub setup in *section 3.2* and press the connect button to connect to Azure IoT explorer.

Figure 26. Enter connection string of IoT Hub

6.3 Run device

If the device is running normally, in Azure IoT explorer you should be able to see the device registering to the IoT Hub through DPS, and receiving data sent from the device to the IoT Hub.

Hub my-rp2040-hub-prov > Devices

 New  Refresh  Delete

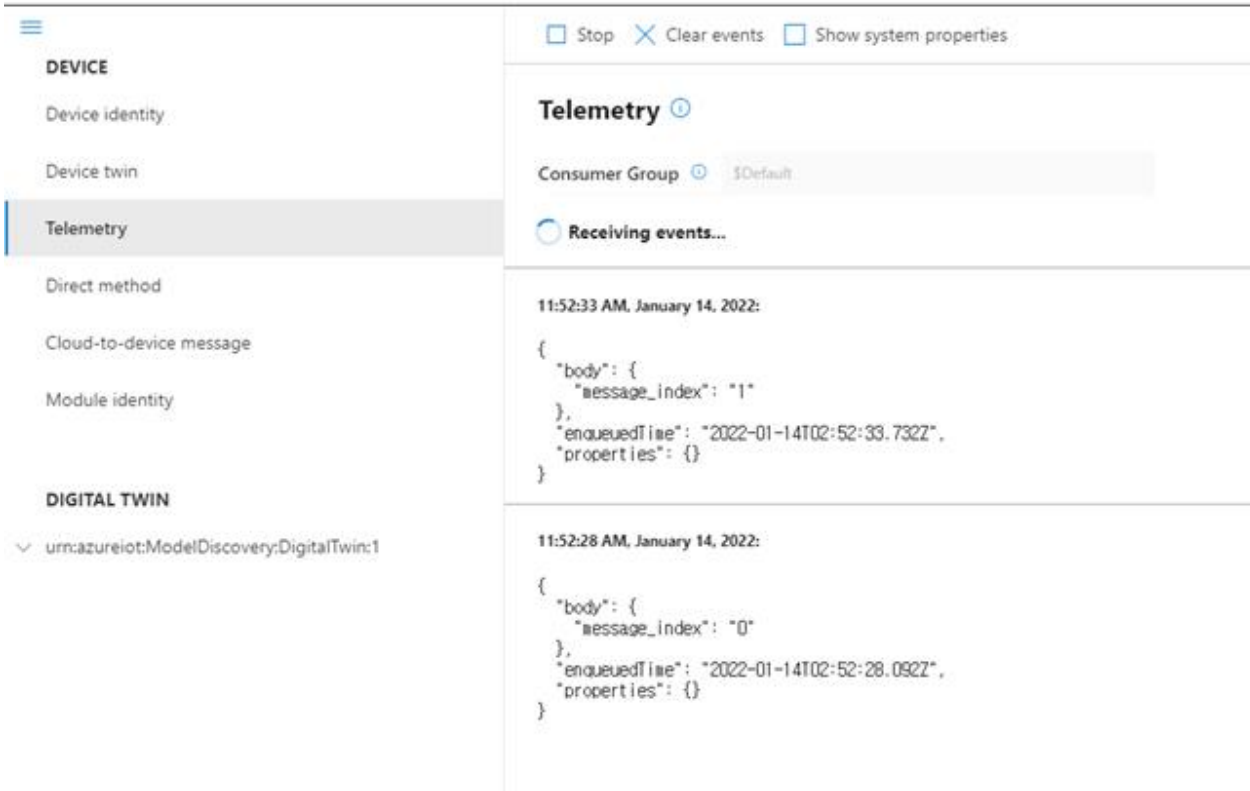

Query by device ID...

 Add query parameter

Device ID	Status	Connection state	Authentication type
my-rp2040-device-prov-x509	Enabled	Disconnected	SelfSigned

Figure 27. Registered device

The screenshot shows the Azure IoT Explorer interface. On the left, a navigation pane lists options under 'DEVICE' (Device identity, Device twin, Telemetry, Direct method, Cloud-to-device message, Module identity) and 'DIGITAL TWIN' (urn:azureiot:ModelDiscovery:DigitalTwin:1). The 'Telemetry' option is selected. On the right, the 'Telemetry' section is active, showing a 'Consumer Group' dropdown set to '\$Default' and a status indicator 'Receiving events...'. Below this, two JSON messages are displayed with their timestamps: '11:52:33 AM, January 14, 2022:' and '11:52:28 AM, January 14, 2022:'. Each message contains a 'body' object with 'message_index' and 'enqueuedTime' fields, and an empty 'properties' object.

Telemetry ⓘ

Consumer Group ⓘ \$Default

○ Receiving events...

11:52:33 AM, January 14, 2022:

```
{
  "body": {
    "message_index": "1"
  },
  "enqueuedTime": "2022-01-14T02:52:33.732Z",
  "properties": {}
}
```

11:52:28 AM, January 14, 2022:

```
{
  "body": {
    "message_index": "0"
  },
  "enqueuedTime": "2022-01-14T02:52:28.092Z",
  "properties": {}
}
```
